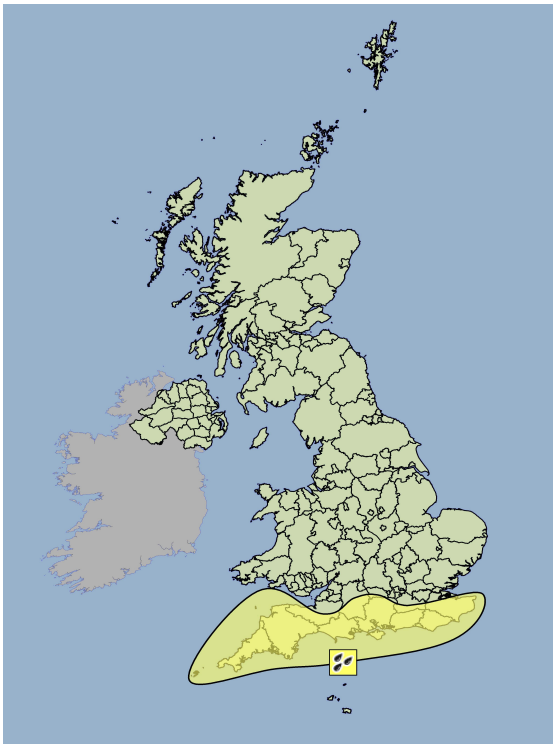
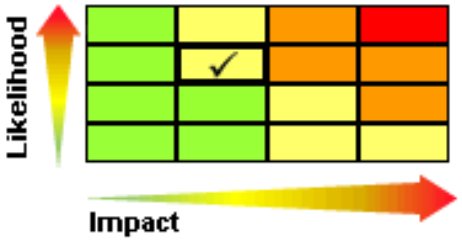
National Severe Weather Warning Service





Chief Forecasters Assessment
Another active Atlantic frontal system and deepening area of low pressure is expected to push northeastwards across the UK on Wednesday, followed by active troughs. A combination of strong winds and moist air will give locally significant rainfall accumulations especially over south-facing coasts and hills. The more persistent rain should clear eastwards later on Wednesday and overnight, but heavy showers will follow on.

The Met Office have issued a **Yellow Alert** of **Rain**

Valid from **06:00 on Wed, 01st Jan 2014** until **23:59 on Wed, 01st Jan 2014**

Further rain, heavy at times is expected to spread quickly northeastwards across southwest and parts of southern England on Wednesday. Rainfall totals are expected to be widely 10-20 mm, but as much as 30-40 mm over some south facing coasts and hills. South or southwesterly gales with gusts 50-60 mph may also accompany the rain.

With ground already saturated over much of this area, the public should be aware of the risk of further localised flooding.

There are some uncertainties over the detail and the public are advised to monitor our web site for updates.
